Currently, English is considered an international language, it can certainly be useful in my life and in my future career. I decided to choose such a profession as a geologist. English is the main part of a geologist's job. With a good knowledge of English, I would feel more confident in my work.

Now I would like to express my point of view on the problem of learning foreign languages. For a geologist who often communicates with foreigners, English would be necessary. Especially when the geologist himself feels comfortable during communication and there are no boundaries.

Geologists often travel around the world and it is always important for them to be able to quickly adapt and communicate with citizens without any restrictions or difficulties, ignorance of the language is a huge obstacle. It is needed at international conferences, congresses and festivals, and when doing research, it would be important to feel this atmosphere.

In short, English is very important in our lives and in our future careers. Therefore, learning English is very important in today's global world. If a person wants to excel in their chosen field, they need to know English, so start improving your English as soon as possible.

I think that English will gain popularity every year, because it is very interesting to learn it.

To prove the importance of language in our lives, we can give all sorts of examples.

For example:

- good work (graduates, teachers),
- memory training,
- career promotion.

The purpose of the work:

- ◆ To find out whether I will encounter the use of English in my future profession.

The tasks of the research:

- ◆ conduct a survey among your classmates "do you need to know «English»,
- ◆ conduct a survey among teachers on the same topic,
- ◆ analyze the results and draw conclusions.

The object of the research: basic principles of tectonic zoning.

The subject of the research: the relief of the foundation and the modern structure of the platform.

The hypothesis of the research: all students are interesting in learning Geology in English.

I want to devote my life to geology. From an early age, I was interested in the structure of the earth, attracted by its uniqueness products made of natural stones, minerals.

When visiting local history museums, the most surprising thing was the colorful minerals that sparkled so unusually, illuminated by small spotlights. Isn't it exciting to go on an expedition with a huge backpack on your shoulders?

How exciting! In the evening, after work, sing songs around the campfire, fry sausages, cook porridge, drink hot tea and enjoy nature. While we are at a young age, during the campaign, we learn something interesting for ourselves, and experienced geologists not only reveal new things, but also determine the industrial value of the discoveries. Before the development of the fields begins, these "pioneers" must describe the area, select samples and mark them.

My dream is to travel all over the world after graduating from university.

I am ready to devote my life to geology. I want to make some discovery. Contribute to the development of geology. Be useful to humanity.

From our data we concluded that: today, geology plays a huge role in Russia.

For example:

- ◆ 32% of the world's mineral resources are located in our country. The demand for them is constantly growing.

For example, over the past 50 years, the consumption of energy resources, in particular oil, has increased tenfold,

while the population has increased two and a half times. This means that the rate of consumption of these resources is increasing. The question arises as to how long they will last. At the current rate of production, which is about 500 million tons of oil per year, the current reserves should be enough for 20-30 years.

From the research, we made a conclusion:

My dream is to travel all over the world after graduating the university. The profession of a geologist is, first of all, knowledge, as well as the ability to love nature. A romantic and unpredictable profession!
